

Pricing Analyst Recruitment Study Case

Candidate Assessment Brief

Objective

This case study evaluates candidates for the Pricing Analyst role in the following areas:

- Technical setup capability
- Basic Python and environment management
- Understanding of Git and GitHub workflows
- Basic bash command usage
- Understanding of deployment process

Overview

Candidates are required to complete the following tasks:

1. Install Anaconda and PyCharm.
2. Create a Python environment.
3. Install the project requirements.
4. Create a GitHub account and repository.
5. Connect the local environment to GitHub.
6. Deploy an initial version using bash commands.
7. Deploy an updated version with new files.

Estimated completion time: 3–5 hours

Business Background

You are joining a company that manages a dynamic pricing tool for exported B2B canned pineapple products. The tool uses several input variables to evaluate current market conditions and generate an appropriate price for each period.

Examples of pricing inputs include:

- Product cost
- Global supply

Your task in this case study is to prepare the development environment that supports this pricing engine.

Task 1 — Install Required Tools

Task description: Install the required tools before starting the case study.

Requirements:

- Anaconda
- PyCharm Community Edition
- Git

Example command:

```
git --version
```

Deliverables:

- Screenshot showing Anaconda is installed
- Screenshot of the PyCharm interface
- Terminal output showing the installed Git version

Task 2 — Create Python Environment

Task description: Create a new Python environment for the case study.

Requirements:

- **Environment name:** pricing_engine
- **Python version:** 3.11

Example commands:

```
conda create -n pricing_engine python=3.11
```

```
conda activate pricing_engine
```

Deliverables:

- Screenshot of the activated environment
- Output showing the installed Python version

Task 3 — Install Requirements

Task description: Install all packages listed in the *requirements.txt* file.

Requirements:

- Use the existing *requirements.txt* file in the project.

Example command:

```
pip install -r requirements.txt
```

Deliverables:

- Screenshot showing a successful installation

Task 4 — Create GitHub Account & Repository

Task description: Create a GitHub account and set up a repository for the case study.

Requirements:

- Create a GitHub account if you do not already have one
- Create a repository named *pricing-engine-case-study*

Deliverables:

- GitHub profile link
- Repository link

Task 5 — Connect Local Project to GitHub

Task description: Initialize Git in the project folder and connect the local project to your GitHub repository.

Requirements:

- Initialize the local repository
- Commit the current project files
- Push the project to GitHub

Example commands:

```
git init
git add .
git commit -m "Initial commit"
git remote add origin <repository_url>
git push -u origin main
```

Deliverables:

- Screenshot showing a successful push
- Repository containing the project files

Task 6 — Deploy Initial Version Using Bash

Task description: Create and push the initial version update using the version label **V1.00**.

Requirements:

- Create a new commit
- Push the updated version to GitHub

Example commands:

```
git status
git add .
git commit -m "Initial version deployment"
git push
```

Deliverables:

- Screenshot of the commit history
- Updated GitHub repository

Task 7 — Deploy New Version with Updated File

Task description: Create a new version update using the version label **V1.01**.

Requirements:

- Add the files for product cost and global supply
- Commit the changes
- Push the updated version to GitHub

Example commands:

```
git add .  
git commit -m "Version V1.01 update"  
git push
```

Deliverables:

- Screenshot of the updated commit history
- GitHub repository showing the new version update
